

Compartment Review Presentation

Gwinn Forest Management Unit

Compartment 32067

Entry Year: 2026

Acreage: 1,587

County: Marquette

Management Area: Menominee-Marquette

Stand Examiner: Matt Yeo

Legal Description:

T43N, R25W, Sections 16-18

Identified Planning Goals:

Planning will focus on timber management, forest recreation, fisheries management and wildlife habitat management. Public access, forest road maintenance, trespass incidents, forest regeneration, forest health, forest fire management, stream crossings, water quality and any resource damage are critical assessments considered during the forest mapping and inventory process.

Soil and topography:

Lowland soils include: Tawas-Deford mucks; Carbondale and Tawas soils; Histosols and Aquents, ponded; Greenwood and Dawson soils; and Kinross mucky peat. Upland soils include: Croswell sand; Au-Gres-Deford complex; Au-Gres sand; Paquin-Finch sands; Emmet-Escanaba complex; Rubicon sand; Sayner-Rubicon complex; Nadeau-Mancelona complex; Paquin sand; and Kalksaka sand. Terrian is gently rolling to flat with a few low banks above waterways.

Ownership Patterns, Development, and Land Use in and Around the Compartment:

All ownership within this compartment is state except for a single forty in section 18. The compartment is adjacent to a very large block of state ownership to the north, east and south. A large area of non-CFR Plum Creek lands is adjacent to the west edge of this compartment. These Plum Creek lands are leased by private parties and several rustic camps are located on these lands.

Unique Natural Features:

Rich conifer swamp found in Section 16.

Archeological, Historical, and Cultural Features:

No Archeological, Historical, or Cultural Features known.

Special Management Designations or Considerations:

Watershed and Fisheries Considerations:

This compartment contains Chynes Creek, the Little West Branch Escanaba River, and Lone Pine Creek. Chynes Creek, the Little West Branch Escanaba River, and Lone Pine Creek are designated Type 1 trout streams less than 50-ft wide and have predicted mean July temperatures that range from 63.2 to 64.9 °F (cold streams). 300-foot buffers are recommended for waterbodies in riparian areas susceptible to Aspen regeneration. For areas not susceptible to Aspen regeneration, a minimum 100-foot, plus 5 feet per 1% increase in slope, buffer is recommended to protect these areas in accordance with Best Management Practices.

Wildlife Habitat Considerations:

This compartment is found within the Menominee-Marquette Management Area, on ground moraines in northern Dickinson and southern Marquette Counties. The dominant Natural Communities are mesic northern forest, poor conifer swamps, and dry mesic northern forest. Major forest cover types include Aspen, Northern Hardwoods, and Mixed Lowland Conifers. Almost every cover type and associated species can be found within the management area including several deer wintering complexes. This management area provides some of the finest grouse and woodcock hunting in the Midwest and this is a wildlife management priority that will continue. Wildlife management issues in the management area are early successional forest conditions (associated with alder, riparian zones, or forested wetlands); mast (hard and soft); habitat fragmentation; mature forest (upland deciduous, especially aspen and mixed forest with little understory); coarse woody debris; and deer wintering complexes.

The following have been identified as featured species for the Menominee-Marquette Management Area: American Woodcock, Blackburnian Warbler, Cerulean Warbler, Golden-winged Warbler, Black-backed Woodpecker, Ruffed Grouse, Turkey, American Marten, Snowshoe Hare, White-tailed Deer, Black Bear.

Mineral Resource and Development Concerns and/or Restrictions

Sections 16 - 18, T43N-R25W, Marquette County

Surface sediments consist of medium-textured till (drumlin area) and glacial outwash sand and gravel and postglacial alluvium. There is insufficient data to determine the glacial drift thickness. The Ordovician Prairie du Chien (PdC) Group subcrops below the glacial drift. The PdC could be used for stone. Gravel pits are located to the west and potential is good on the upland areas. Abandoned iron mines are located nine miles to the north. Section 18 is leased for metallic exploration. There is no economic oil and gas production in the UP.

Vehicle Access:

Paved and plowed County Road 557 passes through the compartment. Leighton Road, a DNR forest road provides access into section 18. This road is gated once it crosses onto Plum Creek lands. Leighton road provides important access to these Plum Creek lands and camps. Several DNR forest roads provide access to the east of County Road 557 and off DNR Little West Road. Streams and lowlands prevent vehicle access to certain portions of this compartment.

Survey Needs:

None known.

Recreational Facilities and Opportunities:

Hunting, fishing, berry picking, mushroom picking, trapping, off-road vehicle usage and snowmobiling are the primary undeveloped recreation uses. There are no dedicated recreation facilities in this compartment.

Fire Protection:

Additional Compartment Information:

A major powerline right-of-way follows the west side of County Road 557.

The following reports from the Inventory are attached:

- Total Acres by Cover Type and Age Class**
- Cover Type by Harvest Method**
- Proposed Treatments – No Limiting Factors**
- Proposed Treatments – With Limiting Factors**
- Stand Details (Forested and Nonforested)**
- Dedicated and Proposed Special Conservation Areas**
- Site Condition Details**

The following information is displayed, where pertinent, on the attached compartment maps:

- Base feature information, stand boundaries, cover types, and numbers**
- Proposed treatments**
- Site condition boundaries**
- Details on the road access system**

----	-------------	-----	--------------	------------	--	-------------	--------------	-----------------	--------------	--	----

Prescription Plant scattered native/non-GMO mast producing trees/shrubs as appropriate and cover crops in herbaceous openings according to local site conditions to promote forage for specified wildlife species. Hand/mechanical removal of brush/vegetation from the opening will be used to maintain the openings and hunter walking trails--current and future; disking, mowing, cultipacking, pesticide application may be used as necessary to accomplish wildlife goals. Partial completion reports will be completed annually for the duration this FTP is valid, describing completed work.

Next Step

Treatments:

Acceptable Site to be maintained as opening.

Regen:

Other

Comment:

Site to be maintained as opening. If adjacent stands are to be harvested, please consult with Wildlife Technician Caleb Eckloff for practices to maintain the opening. Examples include roller-chopping, herbicide, minimum harvest spec., use of the opening as a decking area, etc. to clear encroaching vegetation. There is a hunter walking trail within the stand. It is to be managed apart from the bulk of the forested stand. As such, the walking trail alone will be managed as described in the Prescription Specifications. Post timber harvest of any adjacent stands, if the hunter walking trail is utilized by harvest equipment, it is asked that the purchaser/harvester clear debris and level the trail for WLD staff or designee to plant a cover crop.

Site Condition:

Proposed Start Date: 10/1 /2025

-----------	----------------------------------	-----	---------------------------	------------	--	--------------	--------------	-----------------	--------------	----

Prescription Plant scattered native/non-GMO mast producing trees/shrubs as appropriate and cover crops in herbaceous openings according to local site conditions to promote forage for specified wildlife species. Hand/mechanical removal of brush/vegetation from the opening will be used to maintain the openings and hunter walking trails--current and future; disking, mowing, cultipacking, pesticide application may be used as necessary to accomplish wildlife goals. Partial completion reports will be completed annually for the duration this FTP is valid, describing completed work.

Report 5 – PROPOSED SPECIAL CONSERVATION AREA* (SCA) DETAILS

* This is a partial list of SCAs for this compartment. Not included are those areas identified under other Department initiatives (Natural Rivers, Deer Wintering Areas, etc.). Those will be identified in separate, future map and report products.

SCA Name	SCA Category	Detail Type	Recommendation	Acres
----------	--------------	-------------	----------------	-------

Comments

Report 6 – EXISTING SPECIAL CONSERVATION AREA DETAILS

* This is a list of SCA's for this compartment along with a 1/4 mile buffer surrounding the compartment. Refer to the Special Conservation Area Map for locations of the below listed Conservation Areas.

ERA = Ecological Reference Area
HCVA = High Conservation Value Area
SCA = Special Conservation Area

Conservation Area	Type	Description
SCA	Cold Water Lake	A coldwater lake has temperature and dissolved oxygen conditions that allow naturally-reproduced or stocked trout populations and those of other coldwater fish species to persist from year to year. Suitable conditions for coldwater fishes may occur in Michigan lakes if they are relatively deep, have substantial groundwater inflows, or are located in colder (northern) areas of the state. Such lakes are established by Director's action and designated as trout resources by Fisheries Order 200.
SCA	Cold Water Stream	A coldwater stream has temperature and dissolved oxygen conditions that allow naturally-reproduced or stocked trout populations and those of other coldwater fish species (e.g., slimy sculpin) to persist from year to year. Coldwater streams in Michigan typically provide these conditions due to substantial contributions of groundwater to their stream flows. Such streams are established by Director's action and designated as trout resources by Fisheries Order 210.
SCA	Riparian Area	A transitional area between aquatic and terrestrial ecosystems in which the terrestrial ecosystem influences the aquatic ecosystem and vice-versa. Because of the unique conditions adjacent to lakes, streams and open water wetlands, riparian areas harbor a high diversity of plants and wildlife. Riparian communities are ecologically and socially significant in their effects on water quality and quantity, as well as aesthetics, habitat, bank stability, timber production, and their contribution to overall biodiversity.
ERA	Ecological Reference Areas	Ecological Reference Areas (ERAs) are high quality examples of natural communities that have been identified as Element Occurrences (EOs) by the Michigan Natural Features Inventory (MNFI) within the context of their natural community classification system. Element Occurrences with viability ranks of A (Excellent) or B (Good) and a Global (G) or State (S) element (rarity) ranking of endangered (1), threatened (2), or rare (3) serve as an initial base of ERAs. They may be located upon any ownership in the State. The system is comprised of individual or associations of natural community types that are managed for restoration and maintenance of natural ecological processes and values. The public may submit recommendations for lands as ERAs using the DNR Conservation Area Recommendation Form.

						Avg. Height	
						Size	
2018: Higher occurrence of spruce and fir along north edge of stand. Frequent aspen snags and spiketop boles. Fir is overmature. Cedar, sugar maple, white birch and white pine uncommon overstory associates. White pine and white spruce saplings present. 4/18/24: Aspen is regenerating well, dominating the stand. Two age stand, residual trees left behind from last harvest, sugar maple and red maple poles/logs mainly, not many left behind. Aspen is small 1-2", lots under 1". Good amount of residual red maple and sugar maple in the southeastern part of the stand above stand 55. Mixed in balsam fir saplings, some scattered white spruce saplings. Fair amount of standing dead snags present as well. Good amount of raspberry in understory, low amount of red maple is low. Some open patchy areas in the stand, open areas are most likely old skid trails and landings, some slash in areas that is restricting growth. Black spruce poles and red maple poles on stand edge in the north between stand 54 and 125. Heavy conifer presence along west stand edge all along the highway. Uncut buffer retention area (narrow strip on a hillside inbetween stand 54 and 124) of aspen, spruce, and fir along the northern stand edge running west towards the highway, mainly poles.							

55	6220 - Alder/willow	Nonstocked	1.3		Unspecified	No	2014: Predominantly willow and leatherleaf.
4/18/24: Open area, wet patches, standing water. Willow dominant, scattered red maple, balsam fir, and white pine along stand edge. Grass and leatherleaf present.							

56	6220 - Alder/willow	Nonstocked	91.2		Unspecified	No	Lone Pine Creek floodplain. 3/28/24: Mainly open floodplain with river flowing through, lots of scattered tag alder. Grass all around/along river, some scattered cedar saplings, few scattered black spruce. Some areas of dead standing cedar, heavier areas of black spruce near stand edges. Overall mainly open floodplain with grasses and tag alder with some scattered cedar and black spruce saplings/seedlings.
-----------	---------------------	------------	------	--	-------------	----	--

57	42390 - Mixed Non-Pine Upland Conifers	Poletimber Medium	8.9	64	51-80	N/A	2019: Semi-open stand. Grass, blueberries and lichens where tree cover absent. White pine and white birch poles present. White pine saplings found. Spruce budworm impacting stand. 4/1/24: North edge of stand has scattered cedar logs/poles. Lots of scattered balsam fir sap/pole, black spruce sap/pole, and red maple sap/poles. Scattered aspen, white spruce, and yellow birch as well. Lots of dead spruce/fir pockets found during time of inventory, spruce budworm has had a significant impact on this stand.
