

Compartment Review Presentation

Traverse City Forest Management Unit

Compartment 61135

Entry Year: 2021

Acreage: 2,281

County: Kalkaska

Management Area: High Sand Plains

Stand Examiner: Steve Crigier

Legal Description:

T25N R06W Sections 6-8, 17 & 18

Identified Planning Goals:

The following sections contain information on vegetation management direction in the form of Desired Future Conditions, 10-Year Management Objectives and Long-Term Management Objectives for each of the major cover types or forest communities within the management area. This information applies to those portions of the forest where active management (e.g., timber harvest, prescribed fire, planting or mowing) will be conducted. In other portions of the state forest, natural succession will achieve ecological objectives. While most stands have a variety of trees species and other vegetation, they are classified by the predominant species.

Soil and topography:

This compartment comprises primarily Rubicon Sand with traces of Saugatuck Sand and Newton Loamy Sand. The only significant elevation changes are along the riparian corridors. The western portion has some larger Spruce, Q-Type, and E-Type stands that are relatively wet. The remainder is dry and flat with either planted red pine or jack pine.

Ownership Patterns, Development, and Land Use in and Around the Compartment:

Private land to the north and west with a subdivision the east. The south edge is state land that is managed out of the Manton office. There are a few small private in holdings.

Unique Natural Features:

Special Conservation Area in the southwest part of the compartment.

Archeological, Historical, and Cultural Features:

None known.

Special Management Designations or Considerations:

KW management area.

Watershed and Fisheries Considerations:

The Manistee River, Big Cannon Creek, and several unnamed tributaries flow through Compartment 135. All streams in Compartment 135 are Designated Trout Streams. The Manistee River and Big Cannon Creek are also protected by the Manistee River Natural Rivers Designation. The Manistee River and Big Cannon Creek host naturally reproducing populations of brook, brown, and rainbow trout. For timber operations near the Manistee River and Big Cannon Creek, Natural Rivers buffers should be followed. The SWSW of section 6 is the location of the "West Sharon Access Site" which is primarily for loading and unloading canoes into the Manistee River.

Wildlife Habitat Considerations:

This compartment falls within the Sharon Kirtland's Warbler (KW) Management Unit. The Kirtland's Warbler Management Plan outlines harvest and planting regimes for KW habitat. However, forest treatments should maintain a variety of successional stages of pine-oak-aspen forest and grass-shrub openings, with some mid to late successional forest in places, which is typical of a fire driven landscape. Big Cannon Creek and the Manistee River flow through parts of this compartment and several scattered lowland communities are also located here.

Maintaining a component or deciduous browse in and near deer yards is important. Aspen harvests should be designed to mimic wildfires of various intensities. This creates a mosaic of age classes and increases structural diversity within an area. The creation of dead and downed logs should be incorporated into timber prescriptions to provide habitat for various wildlife species. Standing dead timber is usually left during harvest operations unless deemed a safety hazard. Species associated with pine, oak, and aspen mixed upland forests and openland habitats, such as deer, badger, wild turkey, scarlet tanager, hog-nosed snake, ruffed grouse, Cooper's hawk, red-backed salamander, Kirtland's warbler, and gray squirrel will benefit from management here.

Compartment 135 falls within the Kirtland's Warbler Management Area of the Regional State Forest Management Plan.

Featured wildlife species for this MA include KW, pileated woodpecker, ruffed grouse, snowshoe hare, turkey, and deer.

Mineral Resource and Development Concerns and/or Restrictions

The nearest active sand/gravel production is occurring roughly three miles to the southeast. There appears to be some sand & gravel potential within the compartment, but the water table is shallow here on the outwash plain, which could limit development. The nearest oil & gas production, past or present, is located approximately two miles away, primarily from Devonian carbonates. There has been no exploration and there is no active mineral leasing within the compartment. Oil & gas potential is considered low at this time. There is no known metallic mineral potential in this part of the state. The state does not own all the mineral rights within the compartment. Because the mineral estate is the dominant estate, reasonable access to the surface must be provided to private owners if they choose to explore or develop their mineral rights.

Vehicle Access:

Good access throughout most of the compartment with either county roads or forest two tracks.

Survey Needs:

Existing survey markers should be sufficient for this year of entry treatments.

Recreational Facilities and Opportunities:

West Sharon Access Site.

Fire Protection:

Fire Protection is from the Kalkaska DNR Field Office. Sections 8 and 18 are within Zone 5 dispatch which means additional units from Manton, Grayling, and Houghton Lake respond on a high fire day or above. VFD Fire Protection is from the Garfield Twp. Fire Department. Urban Interface can be an issue in sections 6, 7, and 8 with many private parcels and cabins or homes along the river. Access is not a problem in most of this compartment.

Additional Compartment Information:

The following reports from the Inventory are attached:

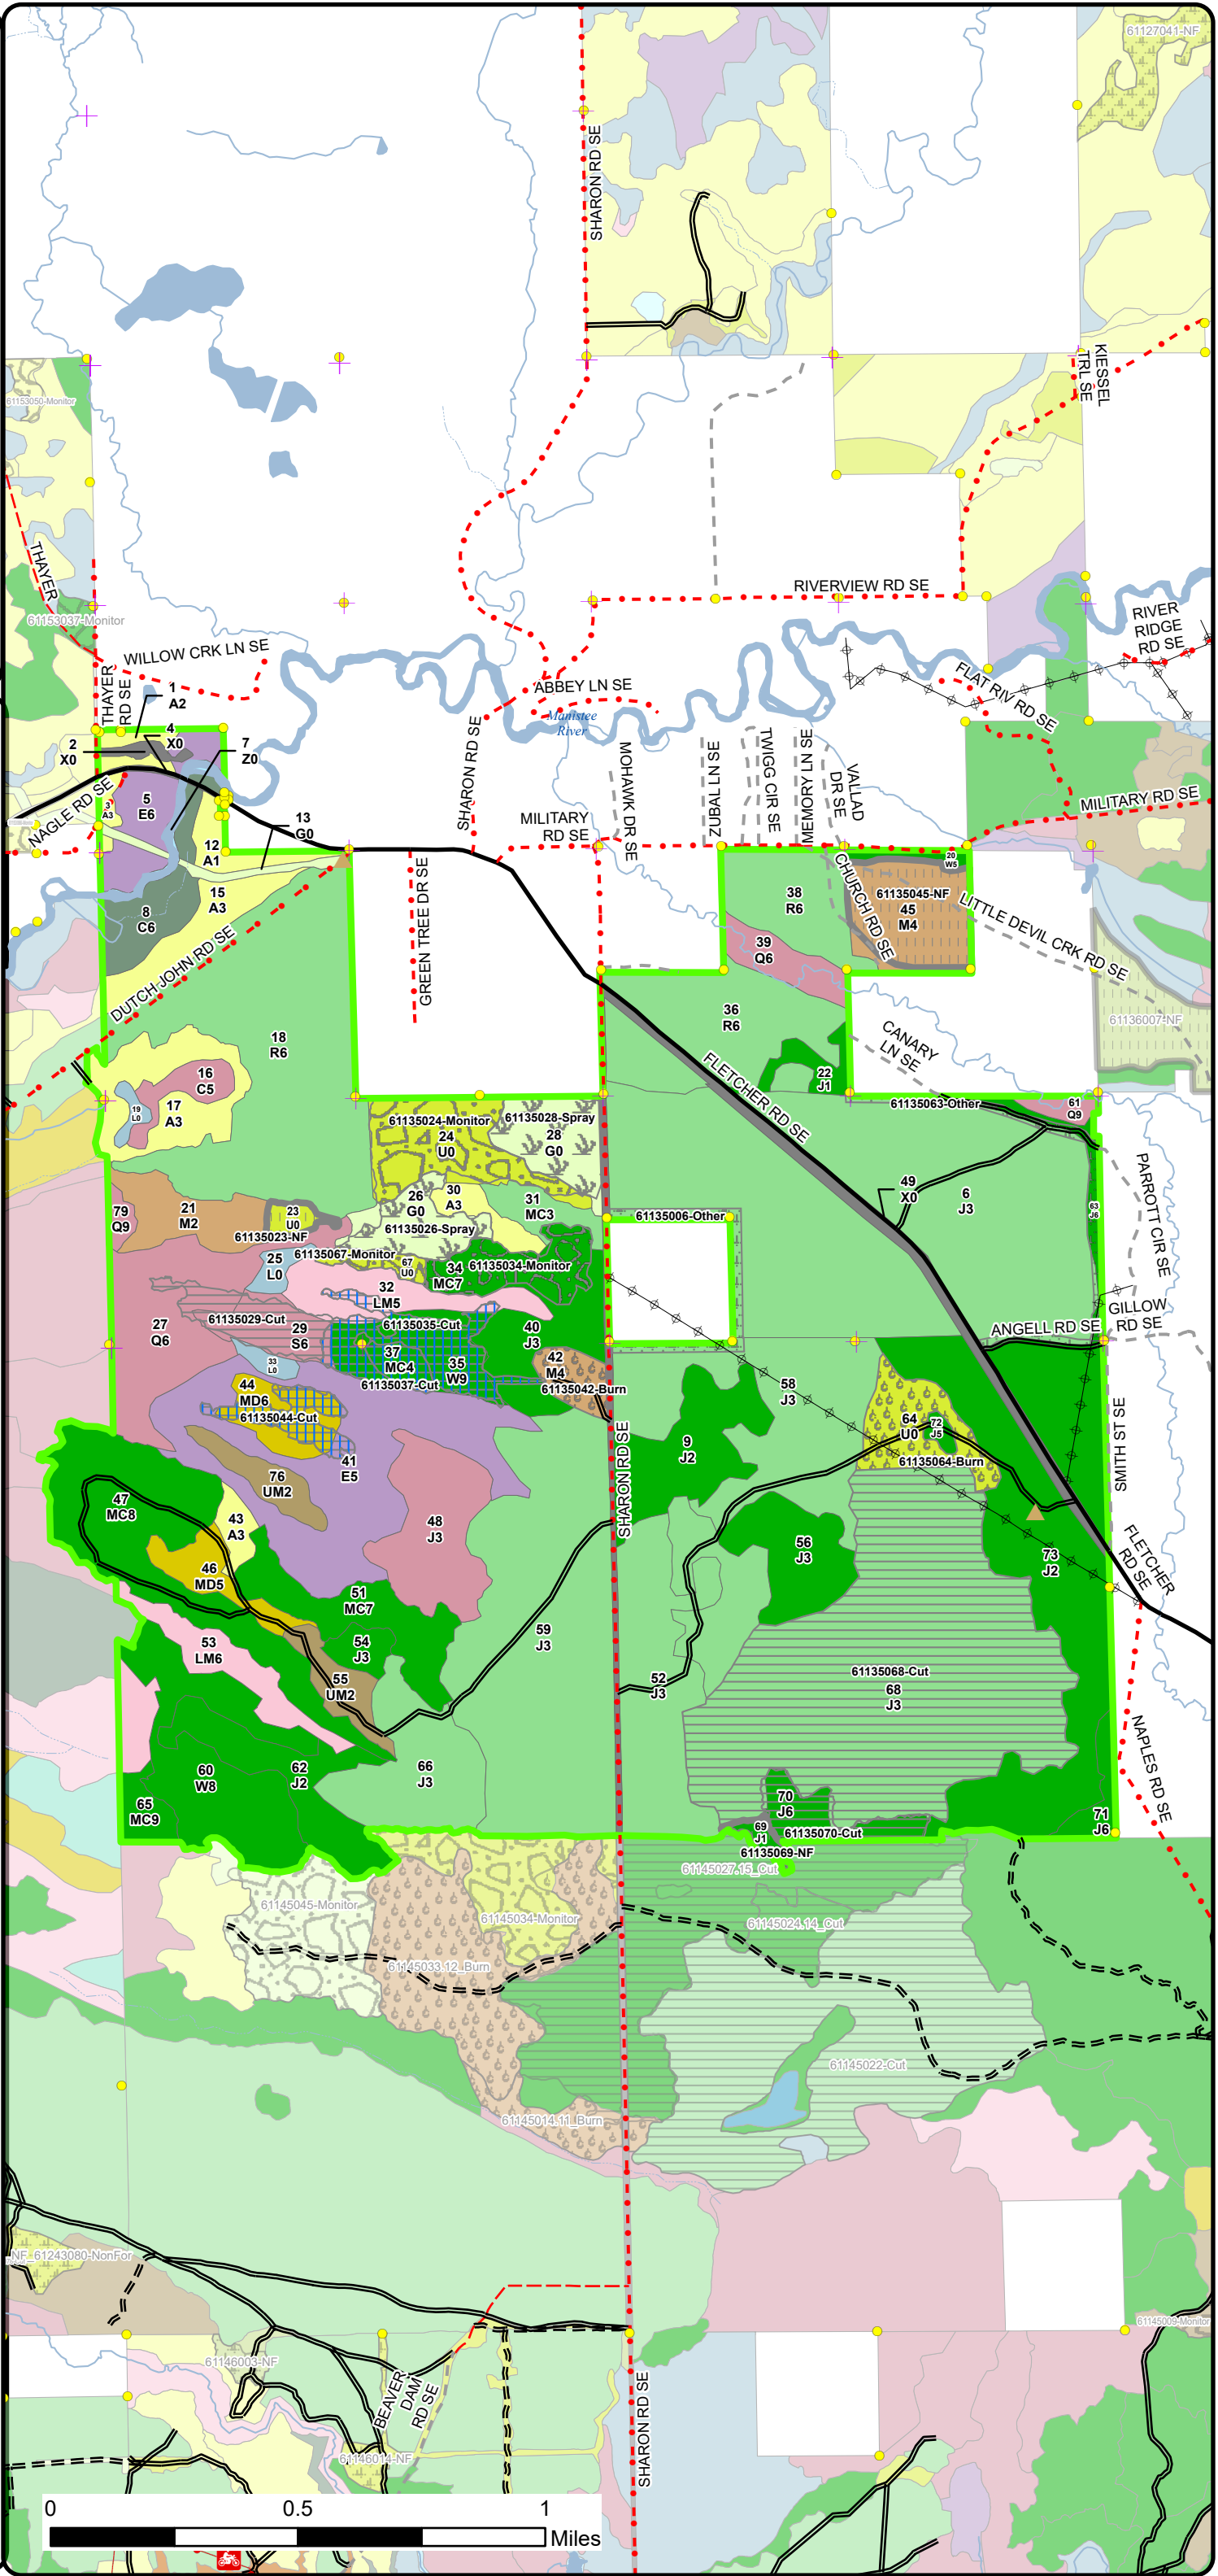

- Total Acres by Cover Type and Age Class**
- Cover Type by Harvest Method**
- Proposed Treatments – No Limiting Factors**
- Proposed Treatments – With Limiting Factors**
- Stand Details (Forested and Nonforested)**
- Dedicated and Proposed Special Conservation Areas**
- Site Condition Details**

The following information is displayed, where pertinent, on the attached compartment maps:

- Base feature information, stand boundaries, cover types, and numbers**
- Proposed treatments**
- Site condition boundaries**
- Details on the road access system**

Report 5 – PROPOSED SPECIAL CONSERVATION AREA* (SCA) DETAILS

* This is a partial list of SCAs for this compartment. Not included are those areas identified under other Department initiatives (Natural Rivers, Deer Wintering Areas, etc.). Those will be identified in separate, future map and report products.

SCA Name	SCA Category	Detail Type	Recommendation	Acres
----------	--------------	-------------	----------------	-------

Comments

Report 6 – EXISTING SPECIAL CONSERVATION AREA DETAILS

* This is a list of SCA's for this compartment along with a 1/4 mile buffer surrounding the compartment. Refer to the Special Conservation Area Map for locations of the below listed Conservation Areas.

ERA = Ecological Reference Area
HCVA = High Conservation Value Area
SCA = Special Conservation Area

Conservation Area	Type	Description
SCA	Cold Water Lake	A coldwater lake has temperature and dissolved oxygen conditions that allow naturally-reproduced or stocked trout populations and those of other coldwater fish species to persist from year to year. Suitable conditions for coldwater fishes may occur in Michigan lakes if they are relatively deep, have substantial groundwater inflows, or are located in colder (northern) areas of the state. Such lakes are established by Director's action and designated as trout resources by Fisheries Order 200.
SCA	Cold Water Stream	A coldwater stream has temperature and dissolved oxygen conditions that allow naturally-reproduced or stocked trout populations and those of other coldwater fish species (e.g., slimy sculpin) to persist from year to year. Coldwater streams in Michigan typically provide these conditions due to substantial contributions of groundwater to their stream flows. Such streams are established by Director's action and designated as trout resources by Fisheries Order 210.
SCA	Riparian Area	A transitional area between aquatic and terrestrial ecosystems in which the terrestrial ecosystem influences the aquatic ecosystem and vice-versa. Because of the unique conditions adjacent to lakes, streams and open water wetlands, riparian areas harbor a high diversity of plants and wildlife. Riparian communities are ecologically and socially significant in their effects on water quality and quantity, as well as aesthetics, habitat, bank stability, timber production, and their contribution to overall biodiversity.
HCVA	Designated Critical Habitat	Critical habitat areas are established via a consultative and cooperative process between the DNR and the U.S. Fish and Wildlife service for the recovery of threatened and endangered species, as governed by Part 365, Endangered Species Protection, of the Natural Resources and Environmental Protection Act, 1994 PA 451, and the Federal Endangered Species Act of 1973. This is an active program, with proposed species plans in various stages of review. As of now only two exist, Kirtland Warbler Habitat and Piping Plover Habitat.
HCVA	Natural Rivers	There are two Natural Rivers datasets which are derived from spatial buffers set from an established and approved distance from the river centerlines. The Natural Rivers Zoning District is a 400 foot buffer for most Natural Rivers. The Vegetative Buffer ranges from 25 to 100 feet.
