INSTITUTE FOR FISHERIES RESEARCH UNIVERSITY MUSEUMS UNIVERSITY OF MICHIGAN ANN ARBOR, MICHIGAN

> REPORT NO. 354 April 29, 1936

ANALYSIS OF FISHING AND THE GAME FISH CATCH IN BUDD LAKE. SUMMER OF 1935

Budd Lake is a long, narrow lake located in the village limits of Harrison on U. S. 27. A survey of this lake by Limar Braman shows that the lake has an area of 150 acres, and a maximum depth of slightly over 30 feet. A chemical and biological survey of this lake has not yet been made but it is anticipated that such a survey will be completed during the coming summer.

The census on Budd Lake was taken by a crew of men from Houghton Camp and was under the supervision of Camp Superintendent Harvey Dawson and Mr. Braman. Unfortunately the crew was not large enough to cover all fishing. The lake has an irregular shape, has extensive resort development and is accessible from a number of places. A relatively large crew would have been needed to thoroughly cover the lake. According to the census-takers the census covered 60% of all fishing. Unless otherwise indicated the figures given below are for those contacted only, consequently represent only about 60% of the fishing.

The census on Budd Lake was taken similar to the census on Fife and other lakes and details of the manner of taking it will not be repeated here.

This report covers only summer fishing which is here considered as extending from June 25th to September 30th inclusive. The data were compiled by the Institute assisted by the Sorting and Tabulating Division of the University of Michigan. The data are listed below. A copy of the census sheet used is also included.

CREEL CENSUS—Michigan Department of Conservation

Fig. 1. Blank used for recording creel census data

Number of fishermen (See Table 1). Census returns were obtained for a total of 2995 fisherman-days, 2495 for men, 493 for women, and 7 with sex not designated. A daily average of 31 persons were contacted. If this number represents 60% of the fishing, a total number of approximately 5000 fisherman-days were represented, averaging for the entire season about 50 fishermen (one per 3 acres) per day. On this basis, the fishing represents a total of approximately 33 fisherman-days per acre. In comparison with fishing on some other northern Michigan lakes for which census data are available, fishing on Budd Lake was relatively heavy.

Number of fish, catch per hour, fish per fisherman, average size of all fish (See Table 2). The 2995 fisherman-days yielded a total of 14,221 fish having an average rength of 7.5 inches and caught at the average rate of 1.5 fish per hour. The catch per hour and catch per fisherman varied considerably, while average size remained relatively the same for the entire season. Fishing was poorest during September. Poor fishing late in the season might be construed as indicating that the lake was "fished out." It is more probable that the chiefly caught species (bluegills) bite best when the water

Table 2. Number of fish taken, fish per hour, fish per fisherman (per day), and average size of all fish. Budd Lake, summer of 1935 is relatively warm and therefore failed to bite well in September when the water was cooling. If the number of fish recorded represents 60% of all fish taken, the lake yielded a total of approximately 23,700 fish or a per acre catch of 158 fish. In comparison with production on other lakes for which census figures are available, Budd Lake was relatively quite productive.

<u>Analysis of the catch by species</u> (See Table 3). The species were, in the order of abundance in the catch: bluegills (<u>Helioperca macrochira</u>), sunfish (<u>Eupomotis gibbosus</u>), small-mouthed bass (<u>Micropterus dolemieu</u>), large-mouthed bass (<u>Aplites salmoides</u>), perch (<u>Perca flavescens</u>), rock bass (<u>Ambloplites rupestris</u>), bullheads (<u>Ameiurus</u>, either nebulosus or natalis, or both) and calico bass (Pomo**xis** sparoides).

The catch consisted primarily of bluegills and sunfish. These two species constituted 92% of all fish (approximately 77% and 16% respectively). The two species of black bass constituted 5% of the fish caught. The relation between predator and pan fish differs somewhat with the relation between the two for other northern lakes, the percentage of predator species being low in Budd Lake. Perch constituted a relatively small per cent of the fish caught; rock bass were even fewer than perch. Budd Lake is, apparently, a bluegill lake and seems to be a relatively productive one.

A decided decline in the per hour catch of bass, rock bass andperch is noted. While poor fishing in September might be regarded as due to a decrease in water temperature, the decline in August is hardly attributable to this cause. It appears that the fish other than bluegills and possibly sunfish were to a considerable degree "fished out" and that they bit poorly later in the season for that reason. <u>Total hours fished and average hours fished</u>. The fishermen for whom records are available fished a total of $9551\frac{1}{4}$ hours, an average of 3.2 hours per fishing day. Obviously fishing on this lake did not occupy a majority of the fishermen's time. If the hours recorded represent 60% of the total hours fished on the lake, each acre was fished, on the average, about 100 hours.

<u>Method of fishing and kind of bait</u> (See Tables 4, 5 and 6). Almost 95% of the fishermen still-fished, relatively few fished by casting or trolling. Those who trolled took on the average relatively large fish and took almost as many per hour as those

Total

Table 3. Analysis of the catch. Budd Lake, summer of 1935

A total of 5 walleyes, 5 bullheads, and 1 calico bass were also reported caught. The size given for the walleyes suggests that these were really perch and were inadvertantly placed in the wrong column by the census-takers.

Table 6. Analysis of catch (by species) on various kinds of bait. Budd Lake, summer of 1935

who still-fished. The method least used produced the best results. It is possible, of course, that those who trolled were, in general, more experienced anglers than those who still-fished. Casting produced the fewest fish (per hour) and, by a very small margin, the largest fish. Approximately a third of those who fished the lake got no fish at all. Details on the various methods used are shown in Table 4.

Six kinds of baits, 3 natural and 3 artificial, were listed. Of the artificial baits, flies were most used. They were more successful in taking fish than were any of the other five baits listed. Over half of the fishermen used worms, a method which took the smallest fish. Insects were used to a considerable extent and were relatively effective in taking fish. With the exception of data for artificial flies, there is a correlation between number of fish taken and size of fish taken, the kind of bait taking the largest fish taking also the fewest and visa versa. Details on kind of bait used are shown in Table 5.

Effectiveness of the various kinds of bait for taking each of the several species and small-mouth is shown in Table 6. It will be noted that large-mouthed, bass bit best on minnows and on plugs, bluegills on insects, worms and artificial fly, sunfish on worms and artificial fly, perch on minnows and rock basson minnows.

Relation between fishing and weather (See Table 7). The records indicate three sets of weather conditions, with reference to clearness (clear, cloudy, rain), roughness (heavy wind, light wind, calm), and temperature (cold, mild, warm). One item in each category was usually checked except that on sheets used during the fore part of the season data with reference to roughness were not included. While a large number of combinations of the nine conditions are possible, the data were obtained only for each weather condition irrespective of the other conditions. These data are listed in Table 7.

Fish, in general, were best caught when the weather was warm, when there was a light wind and when the sky was clear. Whether fishing was best on a warm, clear day, with light wind, is not known since a combination of three factors may not necessarily produce good fishing even though each factor may be best when not considered in combination with the others.

٠ Irrespective of weather

** Sheets used during the early part of the season when fishing was best did not include these three items.

The weather conditions under which each species bit best were:

Large-mouthed Bass: warm weather, rain. Small-mouthed Bass: warm, calm, rain. Bluegill: warm, light wind, cloudy Sunfish: warm, calm, clear Perch: cloudy

Rock Bass: too few taken to permit comparison.

It shoud be understood that the estimates of temperature are with respect to general summer temperature, not to annual temperature. A "cool" day is cool with reference to normal temperature for the period.

<u>Comparison of men and women as fishermen</u> (See Table 8). For the season as a whole men and women caught fish of the same average size. The women however caught fewer fish per hour than men (men took three fishfor each two caught by women). This condition differs considerably from that in Fife Lake where women caught more fish per hour than men. The comparative catch and size of fish caught are shown for each week in Table 8.

Relation between fishing by residents and non-residents (See table 9). Fishing by residents and non-residents were almost identical for the season as a whole, with reference to catch per hour and average size of fish caught by each. Figures for both varied considerably from week to week; residents may have had a relatively good week when non-residents had a relatively poor week and visa versa.

Of the fishermen contacted 23% were non-residents. The states represented, and number and per cent of fishermen from each state were:

N	on-Reside	nts
State	No.	% of non-residents
Illinois	22	3
Indi ana	70	10
Iowa	2	tr.
Missouri	2	tr
Ohio	575	84

Table 9. Number of residents and non-residents, catch per hour and average size of fish caught by each

It will be noted that most of the non-residents were from Ohio.

Residents from a large number of localities fished the lake. By approximate airline distance the number represented from each 25-mile zone are as follows:

Residents Distance from Budd Lake	Nol of Records
(411-3.1110)	No. of Records
0-25	502
25-50	347
50-75	232
75-100	643
100-125	202
125-150	326
150-175	21
175-200	2
300-325	4
No answer	30
Not determined	1
Total	2310

Six zones (0-150 miles) were well-represented. There were more fishing days by those who came 75 to 100 miles than by local residents. A list of the communities and number of fishermen from each locality follows:

Adrian 1, Albion 2, Alma 78, Ann Arbor 8, Auburn 6, Bath 1, Battle Creek 20, Bay City 54, Bellevue 2, Birmingham 1, Breckenridge 8, Camden 1, Carrolton 1, Chapin 4, Charlotte 68, Clare 85, Clarkston 1, Clawson 5, Coldwater 1, Coleman 2, Columbus 2, Corona 2, Dearborn 5, Deerfield 4, Detroit 243, East Lansing 3, Eaton Rapids 9, Ecorse 3, Essexville 2, Ferndale 11, Flint 145, Flushing 1, Foster City 1, Fowler 2, Fowlerville 21, Fremont 1, Gladwin 3, Grand Rapids 27, Grass Lake 2, Greenville 2, Harrison 400, Haslett 3, Hemlock 1, Henderson 2, Highland 1, Holt 5, Houghton Lake 3, Hudson 5, Inkster 12, Ionia 4, Ironwood 4, Ithaca 9, Jackson 124, Jonesville 1, Kalamazoo 6, Lansing 291, Lincoln Park 2, Loretto 1, Manchester 1, Marion 1, Marlette 2, Marshall 1, Martin 4, Mason 5, Marrill 1, Midland 44, Monroe 3, Montgomery 5, Mt. Clemens 3, Mt. Morris 3, Mt. Pleasant 76, Olivet 3, Ovid 1, Owosso 35, Parma 2, Petoskey 1, Plymouth 1, Pontiac 24, Potterville 25, Riverdale 1, River Rouge 2, Rosebush 8, Royal Oak 6, Saginaw 115, St. Johns 43, St. Louis 54, Saline 2, Shepherd 13, Standish 1, Stockbridge 1, Sturgis 1, Troy 2, Vernon 1; Waldron 6, Waltz 1, Warren 2, Wayne 4, Wheeler 56, Williamston 6, Wyandotte 2, Ypsilanti 1. It appears desirable that census on this lake be resumed during the 1936 season in order that comparative figures for the several summers may be available. Should the census be resumed, a somewhat larger crew of census-takers should be used.

Another report comparing fishing between Budd Lake and other lakes for which census figures are available will probably be prepared later.

INSTITUTE FOR FISHERIES RESEARCH
