Gaylord Forest Management Unit

Compartment 52123

Entry Year 2017

Acreage: 986

County Emmet

Management Area: Emmet Moraines

Revision Date: 2015-05-12

Stand Examiner: Donald Stacks

Legal Description:

T36N R04W Sections 4, 5, 18, and 19....

Identified Planning Goals:

To provide for the protection, integrated management, and responsible use of a healthy, productive, and undiminished forest resource base for the social, recreational, environmental, and economic benefit of the State of Michigan.

Soil and topography:

Primarily Blue Lakes Sands.

Ownership Patterns, Development, and Land Use in and Around the Compartment:

Numerous private residences are found around the compartment.

Unique Natural Features:

Potential occurrences include: Red-shouldered hawk, goshawk, bald eagle, osprey, loon, Hungerford's crawling water beetle, Douglas Stenelmis riffle beetle, early hairstreak, large water-starwort, and Michigan monkey flower.

Archeological, Historical, and Cultural Features:

None listed.

Special Management Designations or Considerations:

None listed.

Watershed and Fisheries Considerations:

This compartment is adjacent to the West Branch Maple River, and contains wetlands and other small drainages in the watershed. The West Branch Maple River and its tributaries are designated trout streams. Appropriate buffers should be maintained adjacent to these trout streams. BMPs should be applied near any seeps and drainages.

Wildlife Habitat Considerations:

This small and highly fragmented compartment has a variety of aspen age classes and treatments are designed so they will enhance habitat for deer, grouse, and woodcock. Upland shrub types will be maintained with fruit bearing shrubs to enhance habitat for turkey and other wildlife.

Mineral Resource and Development Concerns and/or Restrictions

Surface sediments consist of coarse-textured till, glacial outwash sand and gravel and postglacial alluvium and minor lacustrine sand and gravel. The glacial drift thickness varies between 400 and 800 feet. The Devonian Traverse Group, Bell Shale and Dundee Limestone subcrop below the glacial drift. The Traverse and Dundee are quarried for stone and cement products. There is a gravel pit approaching the edge of State land in NE¼ SE¼, Section 19 and others in the area. Sand and gravel potential appears good. The nearest oil and gas production, the Antrim Shale gas play, is located 18 miles to the south. There is no known oil and gas potential in the area and no State lands in the compartment are currently leased.

Vehicle Access:

Several county roads and forest trail roads provide access into the compartment.

Survey Needs:

None.

Recreational Facilities and Opportunities:

No designated trails exist within the compartment.

Fire Protection:

The Pellston Field Office and the McKinley Township VFD are both located about one mile east of section 4 of the compartment.

Report 6 – PROPOSED SPECIAL CONSERVATION AREA* (SCA) DETAILS

* This is a partial list of SCAs for this compartment. Not included are those areas identified under other Department initiatives (Natural Rivers, Deer Wintering Areas, etc.). Those will be identified in separate, future map and report products.

SCA Name	SCA Category	Detail Type	Recommendation	Acres
----------	--------------	-------------	----------------	-------

Comments

Report 7 – EXISTING SPECIAL CONSERVATION AREA DETAILS

* This is a list of SCA's for this compartment along with a 1/4 mile buffer surrounding the compartment. Refer to the Special Conservation Area Map for locations of the below listed Conservation Areas.

ERA = Ecological Reference Area
 HCVA = High Conservation Value Area
 SCA = Special Conservation Area

Conservation Area	Type	Description
SCA	Cold Water Stream	A coldwater stream has temperature and dissolved oxygen conditions that allow naturally-reproduced or stocked trout populations and those of other coldwater fish species (e.g., slimy sculpin) to persist from year to year. Coldwater streams in Michigan typically provide these conditions due to substantial contributions of groundwater to their stream flows. Such streams are established by Director's action and designated as trout resources by Fisheries Order 210.
SCA	Riparian Area	A transitional area between aquatic and terrestrial ecosystems in which the terrestrial ecosystem influences the aquatic ecosystem and vice-versa. Because of the unique conditions adjacent to lakes, streams and open water wetlands, riparian areas harbor a high diversity of plants and wildlife. Riparian communities are ecologically and socially significant in their effects on water quality and quantity, as well as aesthetics, habitat, bank stability, timber production, and their contribution to overall biodiversity.
