## STUDY PERFORMANCE REPORT

State: Michigan
Project No.: F-53-R-13
Study No.: 453
Title: Population dynamics of contemporary yellow perch and walleye stocks in
Michigan waters of Green Bay, Lake Michigan

## Period Covered:

$\qquad$

Study Objective: (1) To assemble yellow perch and walleye catch and effort data from the sport and/or commercial fisheries; and, where data are available, determine age and size composition, growth, and mortality of fish in those catches; (2) to establish indices of abundance for prerecruit perch and walleyes and similar indices for populations not monitored by sport or commercial fisheries; (3) to determine discreteness of perch and walleye populations, and movements and range of these populations; (4) to determine interspecific relationships (food habits, predation, and competition for food and space); (5) to determine standing crop and harvestable surplus for perch and walleye populations.

Summary: Creel surveys, assessment netting, and a tagging program produced data for walleye and yellow perch populations in Michigan waters of Green Bay (Big and Little bays de Noc, and open waters south to the Menominee River). Creel surveys have been conducted annually since 1985, assessment netting and tagging since 1988.

According to creel survey estimates, 1996 sport catches were $22 \%$ lower for walleyes, and $107 \%$ higher for yellow perch, compared to 1995 . Fishing effort dropped by $6 \%$.

Approximately 1,000 fish representing 22 species were collected in 1996 assessment nets. Fish were measured or counted, and $38 \%$ were examined to determine sex, maturity, and stomach contents. Yellow perch was the most common species collected ( $47 \%$ of the total number), and walleye ranked eighth ( $1 \%$ of the total). Diet information was summarized from 292 yellow perch, 15 walleye, and 142 other fish of various species. Zebra mussels were found in the stomachs of two perch, one in each bay. Two white suckers were the only other fish found with zebra mussels in their stomachs during the assessment period.

Weak yellow perch year classes were produced in 1996 in both bays, according to trawl sampling. Overall catches of perch were down in Little Bay de Noc in both trawl and gill net samples, but catches of yearling and older perch were moderately strong in Big Bay de Noc relative to other sampling years.

Over 3,000walleye were tagged in spring of 1996. Cumulatively, 31,272 walleye and 19,572 yellow perch have been tagged since 1988. Tag-return data were used to estimate exploitation and survival rates. Exploitation rates for walleye, unadjusted for non-reporting, were $4.6 \%$ in Little Bay de Noc, $1.6 \%$ in Big Bay de Noc, $3.0 \%$ in Cedar River, and $5.8 \%$ in Menominee River. Walleye survival was $60.0 \%$ in Little Bay de Noc, over $95 \%$ in Big Bay de Noc, $86.7 \%$ in

Cedar River, and $41.2 \%$ in Menominee River. The exploitation rate was $3.6 \%$ and survival was 41.8\% for yellow perch in Little Bay de Noc.

## Job 1. Title: Assemble sport and commercial fisheries data from Michigan waters of Green Bay.

Findings: Creel survey data have been collected for the Michigan waters of Green Bay (statistical district MM-1) by Michigan Department of Natural Resources (MDNR) personnel from Districts 2 and 3 since 1985 (Table 1). Creel survey methods and results are summarized under F-53-R, Study 427 by Rakoczy and Rogers (1987, 1988, 1990), Rakoczy and Lockwood (1988), Rakoczy (1992a, 1992b), and Rakoczy and Svoboda (1994). Creel estimates for 1994, 1995, and 1996 have been calculated (G.P. Rakoczy, personal communication, Charlevoix Fisheries Station, Charlevoix, Michigan), but are as yet unpublished. The 1996 walleye catch, estimated from all survey sites combined, was $22 \%$ below the 1995 estimate, but was higher than the 1993-95 average. Yellow perch catch was $107 \%$ higher in 1996 than in 1995, and was the highest estimated catch since 1992. Effort dropped 6\% between 1995 and 1996.

## Job 2. Title: Collect additional biological and abundance data.

Findings: Marquette Fishery Station personnel collected monthly samples of adult and juvenile fish from June through September in both Big and Little bays de Noc. Totaled over all months, standardized sampling effort entailed 40 bottom trawl hauls ( 20 in Little Bay de Noc and 20 in Big Bay de Noc), each of $10-\mathrm{min}$ duration, and 32 overnight gill net sets ( 16 in each bay). The trawl was a shrimp try net with a 10 -ft headrope, 0.75 -in square mesh body, and 0.25 -in square mesh codend liner. Gill nets were $6-\mathrm{ft}$ deep and $120-\mathrm{ft}$ long, with replicated $10-\mathrm{ft}$ panels of experimental monofilament stretch mesh measuring 1.0-, 1.5-, 2.0-, 2.5-, 3.0-, 4.0-in.

Total length, sex, maturity, and diet data were recorded for 292 yellow perch and 15 walleye (Table 2). An additional 262 yellow perch were measured or counted only. Besides walleye and yellow perch, 613 fish, representing 20 other species, were caught. Of these, 142 were measured and examined to determine sex, maturity, and stomach contents.

Yellow perch was the most abundant species present in 1996 assessment netting, and walleye ranked eighth. Similar rankings have occurred in other years. Yellow perch were less abundant in Little Bay de Noc than in Big Bay de Noc, but the opposite was true for walleye.

Catch per unit effort (CPUE) was calculated for yellow perch caught in standard monthly trawl hauls and gill net sets (Table 3). Trawl catches of YOY yellow perch ( $<3.5$ inches) were used as an index of year-class strength, and gill-net catches of perch 7-inches and larger (generally $\geq 3$ years old) were used as an index of abundance for sizes large enough to interest sport anglers. The 1996 YOY CPUE in trawl hauls was relatively weak in both bays de Noc. Gill net CPUEs for yellow perch 7 inches and larger were also relatively low in both bays, but the overall CPUE of perch in gill nets was relatively high in Big Bay de Noc.

Lymphocystis, an endemic viral skin disease common to walleye, especially during spawning (Scott and Crossman 1973), was noted on fish at each tagging location. Compared to 1995, incidence of the disease on 1996 spawning populations increased in Little Bay de Noc from $8 \%$ to $10 \%$, increased in Big Bay de Noc from $6 \%$ to $14 \%$, decreased in Cedar River from $25 \%$ to
$19 \%$, and decreased in Menominee River from $20 \%$ to $16 \%$. Lymphocystis was not seen on any of the 15 walleye caught in assessment nets.

Threespine stickleback is a non-indigenous species that has been collected in Big Bay de Noc assessment nets since 1989. In 1996, 14 threespine sticklebacks were caught in Big Bay de Noc during June and July sampling. White perch is another non-indigenous species whose presence in Little Bay de Noc was first noted in 1990. Fifteen white perch were caught during 1996 sampling, 5 in Little Bay de Noc in June and July, and 10 in Big Bay de Noc (first documentation of white perch in this bay) during August and September.

Bythotrephes cederstroemi have been observed in fish stomachs collected from both bays de Noc since 1988 (Schneeberger 1989, 1991). In 1996, Bythotrephes were found only in stomachs of yellow perch netted in Little Bay de Noc.

Judging from non-quantified observations, abundance of zebra mussels (Dreissena polymorpha) has increased in Little Bay de Noc since they were first seen in 1993. Again during 1996, zebra mussels of various sizes were very abundant on overnight gill net anchors and ropes, in trawl hauls, and on submergent plants (e.g., Chara) in Little Bay de Noc. Only a few zebra mussels were caught or observed during 1995 in Big Bay de Noc, but in 1996, zebra mussels were extremely abundant on vegetation collected via routine trawl sampling. Zebra mussels were present in stomach samples from two yellow perch (one from each bay) and two white suckers (see Job 4).

## Job 3. Title: Determine discreteness of perch and walleye populations.

Findings: In Michigan waters of Green Bay, individually numbered monel bird leg bands have been used to jaw tag 31,332 walleye between 1988 and 1996, and 19,572 yellow perch between 1989 and 1993. Virtually all tagged walleye were of legal size, and $99.8 \%$ of the tagged yellow perch were 7 inches or larger. Of 3,013 walleye tagged in 1996, 700 were tagged in Little Bay de Noc, 1,324 were tagged in Big Bay de Noc, 445 were tagged in or near the Cedar River, and 544 were tagged in the Menominee River (Table 4). Tagging operations were conducted by personnel from the Marquette Fishery Station and from Districts 1, 2, 3, and 4. Additional help for the Menominee River walleye population was provided by personnel from the Wisconsin DNR. Walleyes were tagged coincident with egg-take operations in Little Bay de Noc where fish were collected in fyke nets. Boomshocking boats were used to catch walleyes for tagging in all other locations, though a few were also obtained from commercial pound nets set near the mouth of the Cedar River. Numbers tagged were well below targets except at Little Bay de Noc. Record snowfall and persistent cold temperatures combined to spread spawning over an extended period of time so fish did not congregate in concentrated numbers. Also, melting of record snow accumulations made collections difficult due to high river flows and turbidity.

Advertisements for the return of tags have appeared in local newspapers, sport-club information bulletins, and notices at launch sites. An angler who catches a tagged fish is asked to report the species, tag number, fish length, date of capture, location of capture, whether they kept or released the fish, and their name, address, and phone number to a proximate MDNR office. These data are entered into a computer and a program calculates and stores the number of days between the tag and capture dates, the distance between the tag and capture sites, and the growth of the fish; the program also generates a letter that passes most of this information on to the angler and provides some basic facts about the tagging program. Changes are made annually to
the text of the letter in an attempt to provide new information and retain the interest of participating anglers.

A total of 152 walleye tag returns were reported between May 1996 and April 1997. Returns from fish tagged in Little Bay de Noc included fish that had been tagged in 1988, 1989, and 1991-96. Big Bay de Noc returns came from fish tagged in 1990-93 and 1995-96. Fish from each tagging year 1993-96 contributed to reported catches in Cedar and Menominee rivers. Only one tagged yellow perch (tagged in 1993) was caught in 1996.

A new effort was initiated in 1996 in an attempt to gain further information about tagged fish and walleye fisheries in general. Drop boxes were constructed and placed at 10 access sites throughout the study area. Signs were posted asking walleye anglers to fill out brief catch summary forms that were available from a compartment in the drop boxes. Completed forms could be deposited in a separate slotted portion of drop boxes. Periodic checking by creel clerks and other MDNR personnel resulted in the collection of 89 responses. Forms have only been examined cursorily to date, but interesting information has been obtained including catch data (date, time of day, location, fish length) for tagged, untagged, and undersize walleye. Anglers also provided interesting comments and observations about fishing techniques (e.g., lure selection, fishing depth), the weather, and catches of other species.

## Job 4. Title: Determine forage utilization of perch and walleye in Michigan waters of Green Bay.

Findings: Fish stomach contents were examined in the field and food items were grossly identified and counted. Fish prey were measured and identified to species when possible, insects were identified to order, or family, and zooplankton was considered a broad, inclusive category except that Bythotrephes cederstroemi was differentiated from other zooplankton.

In Little Bay de Noc, diet data were taken from 131 yellow perch and 12 walleye. Fish, zooplankton, (mostly Bythotrephes), aquatic insects, and amphipods were prominent food items in yellow perch stomachs, and one perch stomach contained 20 zebra mussels (Table 5). Most walleye had eaten fish (alewife, yellow perch, and unidentified), and one had eaten a burrowing mayfly nymph (Table 6).

Stomachs were examined from 161 yellow perch and 3 walleye in Big Bay de Noc. Yellow perch ate fish (mostly sticklebacks and darters), aquatic insects, amphipods, zooplankton, and various other food items including one zebra mussel (Table 7). The one walleye stomach that was not empty contained an unidentified fish (Table 8).

## Job 5. Title: Develop population models.

Findings: Exploitation rates (unadjusted for non-reporting) and survival were estimated from tagreturn data using formulae provided by Brownie et al. (1985). Based on cumulative tag returns through 1996, walleye exploitation rates were $4.6 \%$ in Little Bay de Noc, $1.6 \%$ in Big Bay de Noc, $3.0 \%$ in Cedar River, and $5.8 \%$ in Menominee River. Estimated exploitation rate of yellow perch in Little Bay de Noc was 3.6\%. Walleye survival was over $95 \%$ in Big Bay de Noc, $87 \%$ in Cedar River, $60 \%$ in Little Bay de Noc, and $41 \%$ in Menominee River. Survival of yellow perch in Little Bay de Noc was estimated to be $42 \%$.

Using the same factor (2.7) as in past years to adjust for non-reporting, estimated exploitation for walleye was $12.4 \%$ in Little Bay de Noc, $4.3 \%$ in Big Bay de Noc, $8.1 \%$ in Cedar River, and $15.7 \%$ in Menominee River. An adjusted estimate of yellow perch exploitation in Little Bay de Noc was $10 \%$.

Mean length at age was calculated for 157 walleye and 150 yellow perch caught in 1996. Walleye ages were determined from spines collected during tagging near Cedar River (Table 9). Length-at-age was significantly larger for Cedar River female walleyes than for males at ages 4 through 7. Walleye spines were also collected from other tagging locations, but samples have not yet been processed. Yellow perch ages were found by examining scales of fish collected in assessment nets (Table 10). Big Bay de Noc yellow perch were generally larger than those from Little Bay de Noc after age 1. Differences were significant for ages 2 and 3.

## Job 6. Title: Evaluate results and write report.

Findings: This report was prepared on schedule.

Table 5.-Diet data from 131 yellow perch collected in Little Bay de Noc, Jun-Sep, 1996.

| Food category | Observed occurrence in yellow perch stomachs |  |  | Length of yellow perch |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Frequency | Mean number per fish | Months | Min. | Max. |
| Bythotrephes | 25 | 22.7 | 6,7,8,9 | 2.2 | 6.9 |
| Ephemeroptera | 23 | 1.3 | 6,7,8 | 3.8 | 8.0 |
| Diptera | 22 | 4.8 | 6,7,8,9 | 2.8 | 5.6 |
| Fish ${ }^{\text {a }}$ | 17 | 1.7 | 6,7,8,9 | 3.0 | 7.9 |
| Zooplankton | 14 | 14.0 | 6,7,8 | 1.8 | 3.3 |
| Amphipoda | 13 | 3.9 | 6,8 | 3.1 | 5.1 |
| Corixids | 4 | 1.0 | 6,9 | 3.3 | 4.8 |
| Isopoda | 4 | 2.0 | 6 | 3.1 | 4.6 |
| Mollusks ${ }^{\text {b }}$ | 3 | 9.3 | 6 | 4.6 | 8.0 |
| Tricoptera | 3 | 6.3 | 8 | 5.1 | 5.7 |
| Crayfish | 2 | 1.0 | 7 | 5.2 | 5.8 |
| Eggs | 1 | 30.0 | 6 | 3.0 | 3.0 |
| Miscellaneous | 7 | - | 6,7,9 | 2.9 | 8.0 |
| Empty | 33 | - | 6,7,8,9 | 2.1 | 9.9 |

${ }^{\text {a }}$ Johnny darter (8), trout-perch (4), unidentified (7 larvae and 10 juvenile/adults)
${ }^{\mathrm{b}}$ Includes one 4.6 -in yellow perch that had eaten 20 zebra mussels

Table 6.-Diet data from 12 walleye collected in Little Bay de Noc, Jun-Sep, 1996.

|  | Observed occurrence in walleye stomachs |  |  | Length of walleye |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mean number |  |  |  |  |  |
| Food category | Frequency | per fish | Months |  | Min. | Max. |
| Fish $^{\text {a }}$ | 8 | 2.0 | $6,7,8,9$ |  | 4.1 | 20.8 |
| Ephemeroptera | 1 | 1.0 | 7 |  | 17.5 | 17.5 |
| Empty | 3 | - | 6,8 |  | 12.1 | 20.6 |

[^0]Table 7.-Diet data from 161 yellow perch collected in Big Bay de Noc, Jun-Sep, 1996.

| Food category | Observed occurrence in yellow perch stomachs |  |  | Length of yellow perch |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Frequency | Mean number per fish | Months | Min. | Max. |
| Fish ${ }^{\text {a }}$ | 39 | 2.2 | 6,7,8,9 | 4.2 | 9.9 |
| Ephemeroptera | 34 | 2.6 | 6,7,8,9 | 2.4 | 8.4 |
| Amphipoda | 28 | 5.4 | 6,7,9 | 3.0 | 6.2 |
| Zooplankton | 19 | 16.1 | 7,8,9 | 2.0 | 5.5 |
| Crayfish | 10 | 1.1 | 6 | 6.3 | 9.1 |
| Diptera | 8 | 1.8 | 6,7,8,9 | 2.1 | 6.4 |
| Eggs | 4 | 61.8 | 6,7 | 4.5 | 6.3 |
| Mollusks ${ }^{\text {b }}$ | 2 | 1.0 | 6,7 | 4.2 | 6.3 |
| Tricoptera | 2 | 4.5 | 8 | 4.2 | 4.3 |
| Corixids | 1 | 1.0 | 8 | 4.6 | 4.6 |
| Isopoda | 1 | 1.0 | 6 | 6.5 | 6.5 |
| Miscellaneous | 2 | - | 6 | 6.6 | 7.4 |
| Empty | 44 | - | 6,7,8,9 | 2.2 | 8.1 |

${ }^{\text {a }}$ Sticklebacks (26), johnny darter (21), alewife (5), sculpin (1), trout-perch (1), unidentified (32)
${ }^{\mathrm{b}}$ Includes one 6.3 -in yellow perch that had eaten 1 zebra mussel

Table 8.-Diet data from 3 walleye collected in Big Bay de Noc, Jun-Sep, 1996.

| Food category | Observed occurrence in walleye stomachs |  |  | Length of walleye |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Frequency | Mean number per fish | Months | Min. | Max. |
| Fish ${ }^{\text {a }}$ | 1 | 1.0 | 6 | 8.7 | 8.7 |
| Empty | 2 | - | 7 | 16.6 | 21.2 |

Table 9.-Mean length at age for Cedar River walleye, 1996. Total length in inches.

|  |  | Age |  |  |  |  |  |  |
