Cruise Special Instructions:

Temporary plots have been established. Plot center is a wooden stake sticking out at least 4" above the ground, flagged, painted, numbered and easy to see. Additional flagging has been placed overhead so the plot may be easily located. All trees, whether 'cut' or 'leave', which are 'in' using a Limiting Distance Table with a Basal Area Factor of 10 have been marked. Marking consists of a horizontal line (about 6") at dbh and a tree number anywhere on the tree, but clearly visible from plot center. Tree numbers start at 1 for each plot. Every 4th tree is marked in a different color which can be ignored for this test.

Azimuth and distance to the center of the tree at the base from the plot center have been recorded along with species. This information will be provided to you by the DNR in an Excel format. When trees are near the edge of the stand, the 'walkthrough' method (Ducey et al 2004) was used to determine 'in' trees. Trees 'in' from the 'walkthrough' method have been counted twice, have two numbers painted on the tree and are listed twice on the Excel spreadsheet.

Using the tree data in the spreadsheet, cruise each tree on the plot according to the following procedure. An example of the data and tally card is shown on page 5. The entire spreadsheet will be emailed to the winning bidder.

DBH: Measure Diameter at Breast Height (DBH) in the location marked on each tree. Round down to the nearest 10^{th} . Use a d-tape, or the average of a caliper where two measurements are taken at 90° .

 ${
m H_S}(1')$: Measure height for the sawtimber portion of the tree in feet to a 9" Diameter Outside Bark (DOB) or to the sawlog stopper (see Product Standards and Cruising Manual). Round down to the nearest 1'. Minimum DBH is 9.1". If a tree has no sawtimber portion record ${
m H_S}$ as 0 (do not leave blank). This may occur on a tree with no 8' minimum log (9.1" tree with a fork at 6') or has no quality (9.1" tree with branches all the way to the ground). Use a Wheeler Pentaprism®, Laser Ace®, Gator Eyes® or similar device to determine the 9" location on the stem and a clinometer, Relaskop, Laser Ace® or similar device to determine ${
m H_S}$.

 L_{DS} : Length of deduct in the sawtimber portion of the tree recorded to the nearest 1'. This is the length of defect between a 1' stump and H_S1 '. This may be in one section or multiple sections, but is recorded as one number. If in multiple sections, add the sections together and record one number. The minimum length for a sawlog is 8'. There is no maximum length. See Product Standards and Cruising Manual for information on deduct

 L_{DSR} : Length of deduct in the sawtimber portion of the tree that is recoverable for pulpwood recorded to the nearest 1'. The minimum length for recoverable pulpwood is 8'. There is no maximum length. For example, if there is a $(H_S=)30\text{'sawlog}$ section in a tree with a 10' long section in the middle of it that is defective $(L_{DS}=10\text{'})$, 9' of which could be a pulp log, then $L_{DSR}=9\text{'}$.

 $H_4(1')$: Measure height of the tree in feet to a 4" Diameter Outside Bark (DOB). Round down to the nearest 1'. This can be, but is not necessarily the merchantable height. Record height to a 4" DOB regardless of the location of the pulpwood stopper (denoted as H_p). Use a Wheeler Pentaprism®, Laser Ace®, Gator Eyes® or similar device to determine the 4" location on the stem and use a clinometer, Relaskop, Laser Ace® or similar device to determine H_4 . If there is a pulpwood stopper (See Product Standards and Cruising Manual), also record the height to the location of the pulpwood stopper, $H_p(1')$ to the nearest 1'; use a clinometer, Relaskop, Laser Ace® or similar device to determine H_4 .

 $L_{D4}\colon$ Length of deduct in the pulpwood portion of the tree recorded to the nearest 1'. This is the length of defect between the H_S and H_4 (or H_P , if $H_4\neq H_P$). This may be in one section or multiple sections, but is recorded as one number. If in multiple sections, add the sections together and record one number. The minimum length for pulpwood is 8'. There is no maximum length. See Product Standards and Cruising Manual for information on deduct.

In addition to the tree measurements, you must track your time conducting this test. If you are using a portable data recorder, this could be used for time tracking. Time starts when you leave your truck to begin measurement and ends when you return to your truck. If you take breaks or lunch in the woods, then stop your time at the beginning of each break and start when you resume work. This is an important attribute of our test so it is important that you remember to start and stop your time appropriately.

Tally sheets will be provided by the DNR. Output from an electronic data recorder is acceptable.
